

5. Customer / User Journey Map

Design Phase: User Experience & Interaction Mapping

Header	Information
Date	02 October 2026
Team ID	
Project Name	Script-Controlled ACL – Restrict Record Access Based on Field Value
Maximum Marks	4 Marks

User Persona: System User / Security Auditor (User_BB1 to User_BB4)

Phase	Goal	Actions	Touchpoints	Pain Points / Risks	Emotional State	System Response
1. Login & Authentication	Access ServiceNow instance securely	Log in with designated credentials	Login Page / SSO	Forgotten credentials or wrong role assignment	Neutral	Authenticates user and assigns session roles (bb1–bb4).
2. Navigation	Locate the target table records	Navigate to u_institutions.list via Filter Navigator	Left Navigation Menu	Seeing empty list if ACLs are improperly configured	Hopeful	System triggers database query and passes request to ACL

						Engine.
3. ACL Evaluation (Read)	View permitted departmental records	System runs Read ACL script on each record	Security Engine / Database	Latency if script logic is unoptimized	Curious	Checks if <code>u_branch == 'EEE'</code> or admin. Returns filtered list view.
4. Record Modification (Write/Create/Delete)	Perform assigned tasks (Edit, Add, Purge)	Clicks "New", edits fields, or clicks "Delete"	Form View / Action Buttons	"Security restriction prevents this action" message if role is missing	Frustrated (if blocked) / Satisfied (if permitted)	ACL checks <code>bb2</code> (Create), <code>bb3</code> (Write), or <code>bb4</code> (Delete) roles before committing changes to DB.
5. Audit & Compliance Verification	Verify data security integrity	Admin runs security diagnostics on ACL evaluations	ACL Execution Logs / Debugger	Unintended access leaks	Confident	Security logs show explicit ALLOW or DENY traces for every record evaluation.
